File Systems

 Provide set of primitives that abstract users from details of storage access and management.

Consider a contract of the Con

Distributed File Systems

- Promote sharing across machine boundaries.
- · Transparent access to files.
- · Make diskless machines viable.
- Increase disk space availability by avoiding duplication.
- · Balance load among multiple servers.

Comminit © 1995-2003 Cifford Neuman and Doorbo Kim - UNIVERSITY OF SOUTHWAY CALIFORNIA - DIFFORMATION SCHWARS INSTITUTE

Sun Network File System 1

- De facto standard:
 - Mid 80's.
 - Widely adopted in academia and industry.
- Provides transparent access to remote files.
- Uses Sun RPC and XDR.
 - NFS protocol defined as set of procedures and corresponding arguments.
 - Synchronous RPC

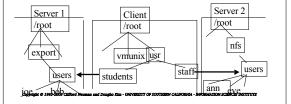

Consists & 1995-2003 CHRed Navman and Donato Firm - THIURESTY (IR SCHTTREEN CALIFORNIA - REPUBLIATION SCHNOR DISTITUTE

Sun NFS 2

- Stateless server:
 - Remote procedure calls are selfcontained.
 - Servers don't need to keep state about previous requests.
 - _Flush all modified data to disk before returning from RPC call.
 - Robustness.
 - No state to recover.
 - _Clients retry.

Location Transparency

- · Client's file name space includes remote files.
 - Shared remote files are exported by server.
 - They need to be remote-mounted by client.

Achieving Transparency 1

- · Mount service.
 - Mount remote file systems in the client's local file name space.
 - Mount service process runs on each node to provide RPC interface for mounting and unmounting file systems at client.
 - Runs at system boot time or user login time.

Achieving Transparency 2

- · Automounter.
 - Dynamically mounts file systems.
 - Runs as user-level process on clients (daemon).
 - Resolves references to unmounted pathnames by mounting them on demand.
 - Maintains a table of mount points and the corresponding server(s); sends probes to server(s).
 - Primitive form of replication

opyright © 1995-2003 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITU

Transparency?

- · Early binding.
 - Mount system call attaches remote file system to local mount point.
 - Client deals with host name once.
 - But, mount needs to happen before remote files become accessible.

Other Functions

- · NFS file and directory operations:
 - read, write, create, delete, getattr, etc.
- Access control:
 - File and directory access permissions.
- · Path name translation:
 - Lookup for each path component.
 - Caching.

Implementation NFS Client process server UnixKernel Unix Kernel VFS RPC NFS Unix Unix FS client FS Client Server

Virtual File System

- VFS added to UNIX kernel.
 - Location-transparent file access.
 - Distinguishes between local and remote access.
- · @ client:
 - Processes file system system calls to determine whether access is local (passes it to UNIX FS) or remote (passes it to NFS client).
- · @ server:
 - NFS server receives request and passes it to local FS through VFS.

2

Server Caching

- Read:
 - Same as UNIX FS.
 - Caching of file pages and attributes.
 - Cache replacement uses LRU.
- Write:
 - Write through (as opposed to delayed writes of conventional UNIX FS). Why?
 - [Delayed writes: modified pages written to disk when buffer space needed, sync operation (every 30 sec), file close].

Conscient & 1995-2003 Cifford Maximum and Donaths Elm. - INSURENTY OR SOLITIONAL CALIFORNIA - INSURALITY OF STREETS INC.

Client Caching 1

- · Timestamp-based cache validation.
- · Read:
 - Validity condition: (T-Tc < TTL) V (Tmc=Tms)
- · Write:
 - Modified pages marked and flushed to server at file close or sync.

Countries & 1005-2003 Clifford Norman and Donelos Elm . IDDURENTY (IR SCHTTEREN) CALIFORNIA . DEFERRATION SCHROLING INSTITUTE

Client Caching 2

- · Consistency?
 - Not always guaranteed!
 - e.g., client modifies file; delay for modification to reach servers + 3sec (TTL) window for cache validation from clients sharing file.

Consider St 1005-2003 Chilled Names and Danels Fig. - THEORY OF CONTROLLY CAMBRIDGE - THEORY OF THE TWO

Cache Validation

- · Validation check performed when:
 - First reference to file after TTL expires.
 - File open or new block fetched from server.
- Done for all files, even if not being shared.
- Why?
- · Expensive!
 - Potentially, every 3 sec get file attributes.
 - If needed invalidate all blocks.
 - Fetch fresh copy when file is next accessed.

The Sprite File System

- · Main memory caching on both client and server.
- · Write-sharing consistency guarantees.
- · Variable size caches.
 - VM and FS negotiate amount of memory needed.
 - According to caching needs, cache size changes.

Sprite

- Sprite supports concurrent writes by disabling caching of write-shared files.
 - If file shared, server notifies client that has file open for writing to write modified blocks back to server.
 - Server notifies all client that have file open for read that file is no longer cacheable; clients discard all cached blocks, so access goes through server.

Sprite

- · Sprite servers are stateful.
 - Need to keep state about current accesses.
 - Centralized points for cache consistency.
 - Bottleneck?
 - _Single point of failure?
- · Tradeoff: consistency versus performance/robustness.

Andrew

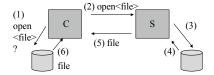

- Distributed computing environment developed at CMU.
- · Campus wide computing system.
 - Between 5 and 10K workstations.
 - -1991: ~ 800 workstations, 40 servers.

Andrew FS

- · Goals:
 - Information sharing.
 - Scalability.
 - _ Key strategy: caching of whole files at client.
 - _ Whole file serving
 - Entire file transferred to client.
 - Whole file caching
 - Local copy of file cached on client's local
 - Survive client's reboots and server unavailability.

Whole File Caching

· Local cache contains several most recently used files.

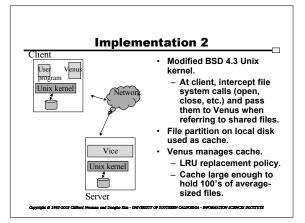

- Subsequent operations on file applied to local copy.
- On close, if file modified, sent back to server.

Implementation 1

- Network of workstations running Unix BSD 4.3 and Mach.
- Implemented as 2 user-level processes:
 - Vice: runs at each Andrew server.
 - Venus: runs at each Andrew client.

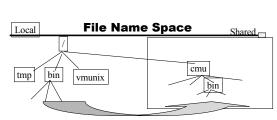

Opyright © 1995-2003 Clifford Neuman and Dongho Rim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTIT

File Sharing

- Files are shared or local.
 - Shared files
 - _Utilities (/bin, /lib): infrequently updated or files accessed by single user (user's home directory).
 - _Stored on servers and cached on clients.
 - Local copies remain valid for long time.
 - Local files
 - _Temporary files (/tmp) and files used for start-up.
 - _Stored on local machine's disk.

Convisit & 1995-2003 Citibed Names and Donato Etc. - INFORESTY OF STITTERS CALIFORNIA - INFORMATION STRATES INSTITTITE

- · Regular UNIX directory hierarchy.
- "cmu" subtree contains shared files.
- · Local files stored on local machine.
- · Shared files: symbolic links to shared files.

Controls & 1995-2003 Citibed Norman and Donatha Elm., IDBURENTY OF STITISTED CALIFORNIA - REPUBLIATION SCHOOLS INSTITUTES

AFS Caching

- AFS-1 uses timestamp-based cache invalidation.
- AFS-2 and 3 use callbacks.
 - When serving file, Vice server promises to notify Venus client when file is modified.
 - Stateless servers?
 - Callback stored with cached file.
 - _Valid.
 - Canceled: when client is notified by server that file has been modified.

Copyright © 1995-2003 Ciliford Heuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - REPORMATION SCHENCES INSTITUTE

AFS Caching

- · Callbacks implemented using RPC.
- When accessing file, Venus checks if file exists and if callback valid; if canceled, fetches fresh copy from server.
- · Failure recovery:
 - When restarting after failure, Venus checks each cached file by sending validation request to server.
 - Also periodic checks in case of communication failures.

Copyright © 1995-2003 Clifford Neuman and Dongho Rim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITU

AFS Caching

- At file close time, Venus on client modifying file sends update to Vice server.
- Server updates its own copy and sends callback cancellation to all clients caching file.
- · Consistency?
- · Concurrent updates?

Opyright © 1995-2003 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITU

AFS Replication

- · Read-only replication.
 - Only read-only files allowed to be replicated at several servers.

DOWNSHE © 1995-2003 Chillord Neuman and Donatio Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUT.

Coda

- · Evolved from AFS.
- · Goal: constant data availability.
 - Improved replication.
 - Replication of read-write volumes.
 - Disconnected operation: mobility.
 - _Extension of AFS's whole file caching mechanism.
- Access to shared file repository (servers) versus relying on local resources when server not available.

Contribut to 1995-2003 Citibut Maumen and Donath Elm . INSURENTY OF STITTERED CATRIBUTA . DESPERATIVE SYMMETS INSTITTITE

Replication in Coda

- Replication unit: file volume (set of files).
- Set of replicas of file volume: volume storage group (VSG).
- Subset of replicas available to client: AVSG.
 - Different clients have different AVSGs.
 - AVSG membership changes as server availability changes.
 - On write: when file is closed, copies of modified file broadcast to AVSG.

Congrishe & 1995-2013 (Billion Marmon and Donato, Rim., IDDURENTY OF STATISTICS CALIFORNIA., INDIVIDUAL STATISTICS DESCRIPTION OF TRACES DESCRIPTIONS

Optimistic Replication

- · Goal is availability!
- Replicated files are allowed to be modified even in the presence of partitions or during disconnected operation.

Copyright © 1995-2003 Citiford Heuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - DIFORMATION SCHWCES INSTITUTE

Disconnected Operation

- AVSG = { }.
- Network/server failures or host on the move.
- · Rely on local cache to serve all needed files.
- · Loading the cache:
 - User intervention: list of files to be cached.
- Learning usage patterns over time.
- Upon reconnection, cached copies validated against server's files.

opyright © 1995-2003 Clifford Neuman and Dongho Rim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUT

Normal and Disconnected Operation

- During normal operation:
 - Coda behaves like AFS.
 - Cache miss transparent to user; only performance penalty.
 - Load balancing across replicas.
 - Cost: replica consistency + cache consistency.
- · Disconnected operation:
 - No replicas are accessible; cache miss prevents further progress; need to load cache before disconnection.

Constitute D 1995-2003 Citibad Marinan and Donato Rim - INSURESTY OF STRITUTES CALIFORNIA - DISCRETATION OF TRAFFIC IN

Replication and Caching

- · Coda integrates server replication and client caching.
 - On cache hit and valid data: Venus does not need to contact server.
 - On cache miss: Venus gets data from an AVSG server, i.e., the preferred server (PS).
 - _ PS chosen at random or based on proximity, load.
 - Venus also contacts other AVSG servers and collect their versions; if conflict, abort operation; if replicas stale, update them off-line.
