Kernels

- Executes in supervisory mode.
 - Privilege to access machine's physical resources.
- User-level process: executes in "user" mode.
 - Restricted access to resources.
 - Address space boundary restrictions.

Copyright © 1995-2004 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Kernel Functions

- Memory management.
 - Address space allocation.
 - Memory protection.
- Process management.
 - Process creation, deletion.
 - Scheduling.
- Resource management.
 - Device drivers/handlers.

Copyright © 1995-2004 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

System Calls

System call: implemented by hardware interrupt (trap) which puts processor in supervisory mode and kernel address space; executes kernel-supplied handler routine (device driver) executing with interrupts disabled.

Copyright © 1995-2004 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Kernel and Distributed Systems

- Inter-process communication: RPC, MP, DSM.
- File systems.
- Some parts may run as user-level and some as kernel processes.

Copyright © 1995-2004 Clifford Neuman and Dongho Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Be or not to be in the kernel?

- Monolithic kernels versus microkernels.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Monolithic kernels

- Examples: Unix, Sprite.
- “Kernel does it all” approach.
- Based on argument that inside kernel, processes execute more efficiently and securely.
- Problems: massive, non-modular, hard to maintain and extend.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Microkernels

- Take as much out of the kernel as possible.
- Minimalist approach.
- Modular and small.
 - 10KBytes -> several hundred Kbytes.
 - Easier to port, maintain and extend.
 - No fixed definition of what should be in the kernel.
 - Typically process management, memory management, IPC.

Micro- versus Monolithic Kernels

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Microkernel

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

The V Distributed System

- Stanford (early 80's) by Cheriton et al.
- Distributed OS designed to manage cluster of workstations connected by LAN.
- System structure:
 - Relatively small kernel common to all machines.
 - Service modules: e.g., file service.
 - Run-time libraries: language support (Pascal I/O, C stdio)
 - Commands and applications.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

V's Design Goals

- High performance communication.
 - Considered the most critical service.
 - _ Efficient file transfer.
 - “Uniform” protocol approach for open system interconnection.
 - _ Interconnect heterogeneous nodes.
 - “Protocols, not software, define the system”.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

The V Kernel

- Small kernel with basic protocols and services.
- Precursor to microkernel approach.
- Kernel as a “software backplane”.
 - Provides “slots” into which higher-level OS services can be “plugged”.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Distributed Kernel

- Separate copies of kernel executes on each node.
- They cooperate to provide “single system” abstraction.
- Services: address spaces, LWP, and IPC.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

V's IPC Support

- Fast and efficient transport-level service.
 - Support for RPC and file transfer.
- V's IPC is RPC-like.
 - Send primitive: send + receive.
 - _ Client sends request and blocks waiting for reply.
 - _ Server: processes request serially or concurrently.
 - _ Server response is both ACK and flow control.
 - It authorizes new request.
 - Simplifies transport protocol.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

V's IPC

Support for short, fixed size messages of 32 bytes with optional data segment of up to 16 Kbytes; simplifies buffering, transmission, and processing.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

VMTP (1)

- Transport protocol implemented in V.
- Optimized for request-response interactions.
 - No connection setup/teardown.
 - Response ACKs request.
 - Server maintains state about clients.
 - _ Duplicate suppression, caching of client information (e.g., authentication information).

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

VMTP (2)

- Support for group communication.
 - Multicast.
 - Process groups (e.g., group of file servers).
 - _ Identified by group id.
 - _ Operations: send to group, receive multiple responses to a request.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

VMTP Optimizations

- Template of VMTP header + some fields initialized in process descriptor.
 - Less overhead when sending message.
- Short, fixed-size messages carried in the VMTP header: efficiency.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

V Kernel: Other Functions

- Time, process, memory, and device management.
- Each implemented by separate kernel module (or server) replicated in each node.
 - Communicate via IPC.
 - Examples: kernel process server creates processes, kernel disk server reads disk blocks.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Time

- Kernel keeps current time of day (GMT).
- Processes can get(time), set(time), delay(time), wake up.
- Time synchronization among nodes: outside V kernel using IPC.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Process Management

- Create, destroy, schedule, migrate processes.
- Process management optimization.
 - Process initiation separated from address space allocation.
 - _ Process initiation = allocating/initializing new process descriptor.
 - Simplifies process termination (fewer kernel-level resources to reclaim).
 - Simplifies process scheduling: simple priority based scheduler; 2nd. level outside kernel.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Memory Management 1

- Protect kernel and other processes from corruption and unauthorized access.
- Address space: ranges of addresses (regions).
 - Bound to an open file (UIO like file descriptor).
 - Page fault references a portion of a region that is not in memory.
 - Kernel performs binding, caching, and consistency services.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Memory Management 2

- Virtual memory management: demand paging.
 - Pages are brought in from disk as needed.
 - Update kernel page tables.
- Consistency:
 - Same block may be stored in multiple caches simultaneously.
 - Make sure they are kept consistent.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Device Management

- Supports access to devices: disk, network interface, mouse, keyboard, serial line.
- Uniform I/O interface (UIO).
 - Devices are UIO objects (like file descriptors).
 - Example: mouse appears as an open file containing x & y coordinates & button positions.
 - Kernel mouse driver performs polling and interrupt handling.
 - But events associated with mouse changes (moving cursor) performed outside kernel.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

More on V...

- Paper talks about other V functions implemented using kernel services.
 - File server.
 - Printer, window, pipe.
- Paper also talks about classes of applications that V targets with examples.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

The X-Kernel

- UofArizona, 1990.
- Like V, communication services are critical.
- Machines communicating through internet.
 - Heterogeneity!
 - The more protocols on user's machine, the more resources are accessible.
- The x-kernel philosophy: provide infrastructure to facilitate protocol implementation.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Virtual Protocols

- The x-kernel provide library of protocols.
 - Combined differently to access different resources.
 - Example:
 - _ If communication between processes on the same machine, no need for any networking code.
 - _ If on the same LAN, IP layer skipped.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

The X-Kernel : Process and Memory

- ability to pass control and data efficiently between the kernel and user programs
 - user data is accessible because kernel process executes in same address space
- kernel process -> user process
 - sets up user stack
 - pushes arguments
 - use user-stack
 - access only user data
- kernel -> user (245 usec), user -> kernel 20 usec on SUN 3/75

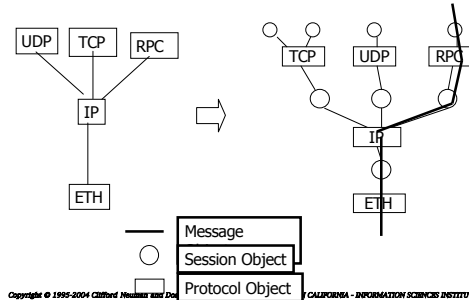

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Communication Manager

- Object-oriented infrastructure for implementing and composing protocols.
- Common protocol interface.
- 2 abstract communication objects:
 - Protocols and sessions.
 - Example: TCP protocol object.
 - _ TCP open operation: creates a TCP session.
 - _ TCP protocol object: switches each incoming message to one of the TCP session objects.
 - _ Operations: demux, push, pop.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

X-kernel Configuration

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Message Manager

- Defines single abstract data type: message.
 - Manipulation of headers, data, and trailers that compose network transmission units.
 - Well-defined set of operations:
 - _ Add headers and trailers, strip headers and trailers, fragment/reassemble.
 - Efficient implementation using directed acyclic graphs of buffers to represent messages + stack data structure to avoid data copying.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Mach

- CMU (mid 80's).
- Mach is a microkernel, not a complete OS.
- Design goals:
 - As little as possible in the kernel.
 - Portability: most kernel code is machine independent.
 - Extensibility: new features can be implemented/tested alongside existing versions.
 - Security: minimal kernel specified and implemented in more secure way.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Mach Features

- OSs as Mach applications.
- Mach functionality:
 - Task and thread management.
 - IPC.
 - Memory management.
 - Device management.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Mach IPC

- Threads communicate using ports.
- Resources are identified with ports.
- To access resource, message is sent to corresponding port.
 - Ports not directly accessible to programmer.
 - Need handles to "port rights", or capabilities (right to send/receive message to/from ports).
- Servers: manage several resources, or ports.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Mach: ports

- *process port* is used to communicate with the kernel.
- *bootstrap port* is used for initialization when a process starts up.
- *exception port* is used to report exceptions caused by the process.
- *registered ports* used to provide a way for the process to communicate with standard system servers.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Protection

- Protecting resources against illegal access:
 - Protecting port against illegal sends.
- Protection through *capabilities*.
 - Kernel controls port capability acquisition.
 - Different from Amoeba.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Capabilities 1

- Capability to a port has field specifying port access rights for the task that holds the capability.
 - Send rights: threads belonging to task possessing capability can send message to port.
 - Send-once rights: allows at most 1 message to be sent; after that, right is revoked by kernel.
 - Receive rights: allows task to receive message from port's queue.
 - _ At most 1 task, may have receive rights at any time.
 - _ More than 1 task may have send/send-once rights.

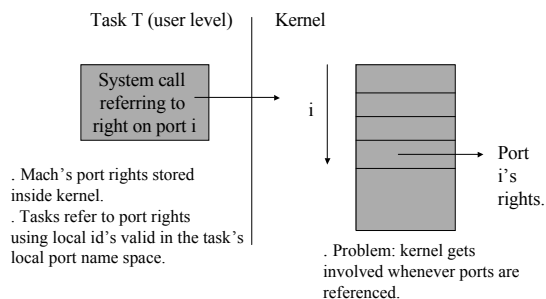

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Capabilities 2

- At task creation:
 - Task given bootstrap port right: send right to obtain services of other tasks.
 - Task threads acquire further port rights either by creating ports or receiving port rights.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Port Name Space

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Communication Model

- Message passing.
- Messages: fixed-size headers + variable-length list of data items.

Header	T	Port rights	T	In-line data	T	Pointer to out-of-line data
--------	---	-------------	---	--------------	---	-----------------------------

Header: destination port, reply port, type of operation.
 T: type of information.
 Port rights: send rights: receiver acquires send rights to port.
 Receive rights: automatically revoked in sending task.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Ports

- Mach port has message queue.
 - Task with receive rights can set port's queue size dynamically: flow control.
 - If port's queue is full, sending thread is blocked; send-once sender never blocks.
- System calls:
 - Send message to kernel port.
 - Assigned at task creation time.

Copyright © 1995-2004 Clifford Neuman and Douglas Kim - UNIVERSITY OF SOUTHERN CALIFORNIA - INFORMATION SCIENCES INSTITUTE

Task and Thread Management

- Task: execution environment (address space).
- Threads within task perform action.
- Task resources: address space, threads, port rights.
- PAPER:
 - How Mach microkernel can be used to implement other OSs.
 - Performance numbers comparing 4.3 BSD on top of Mach and Unix kernels.
